# DIBOSS DR-220A/E SERVICE NOTES

First Edition

## **SPECIFICATIONS**

Memory Capacity

: 32 Preset Rhythm Patterns

32 User's Programmable Rhythm Patterns

Songs 128 bers x 8 (with Song Chain: 256 bars)

: J = 40 to 250 Tempo

Output : Max. Level 2.6  $V_{PP}$  2K $\Omega$ : Less than -80dBm (IHFA) Noise Level Power Requirements: 6V DC (Batteries SUM-3 x 4)

or AC Adaptor BOSS PSA-100, 120, 220 or 240

**Current Draw** 

: 30mA DC at 9V

Battery life **Dimensions**  : Approx. 30 hours (SUM-3)  $: 239(W) \times 75(D) \times 31(H)mm$ 9-7/16 x 2-15/16 x 1-1/4 in.

Weight Accessories : 350g/12oz, including batteries : SUM-3 dry cell batteries x 4 BOSS Original Case x 1

**Options** 

: Connection Cord PJ-1 AC Adaptor BOSS PSA series Sound Sources:

DR-220A Bass Drum

Snare Drum

Closed Hi-hat/Open Hi-hat Rim Shot/Hand Clap Hi Tom/Mid Tom/Low Tom Crash Cymbal/Ride Cymbal

Accent

DR-220E

Electronic Bass Drum Electronic Snare Drum

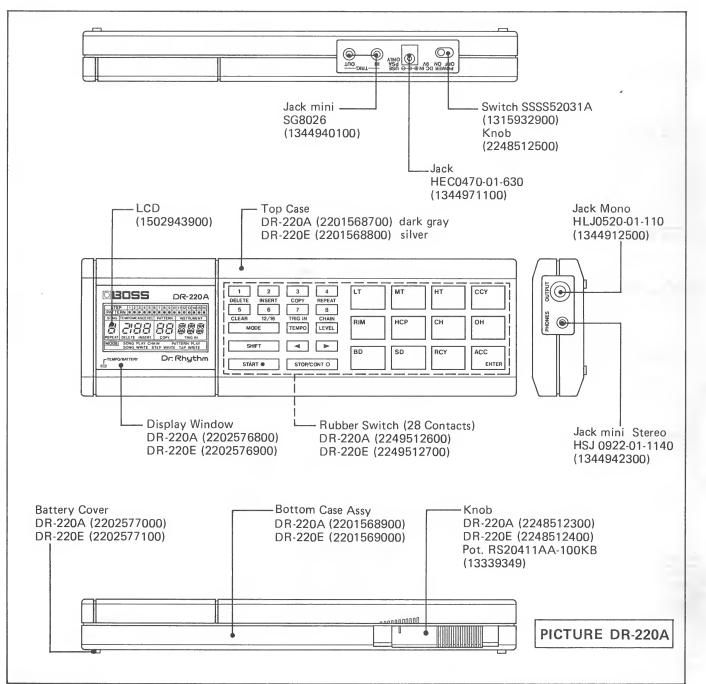

Closed Hi-hat/Open Hi-hat

Cowbell/Slap

Electronic Hi Tom/Electronic Mid Tom

Electronic Low Tom China Cymbal/Cup

Accent

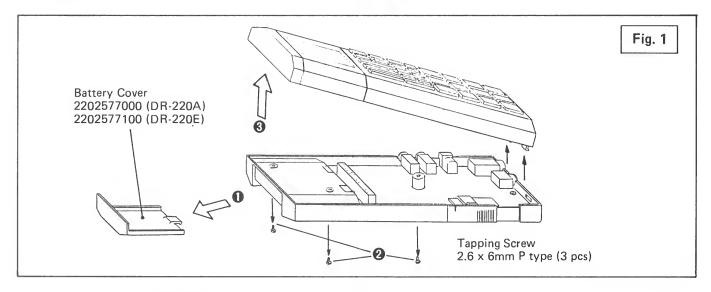

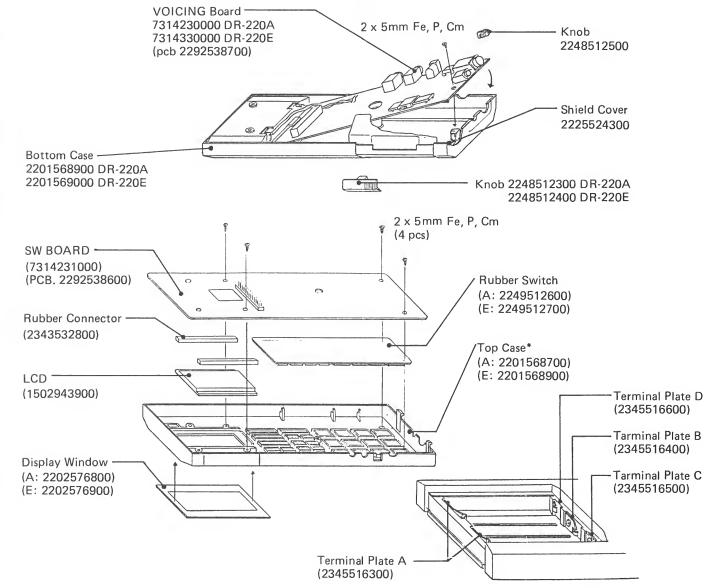

## **DISASSMBLY**

- Place the DR-220 upside down then remove the battery cover.
- 2 Remove 2.6 x 6mm P type tapping screws (3 pcs) on the bottom case.
- 3 Turn the DR-220 over. Grasp the ICD side of the upper case hand then separate the cases as shown in Fig. 1.

## 分解方法

- 底面を上に向け、電池ブタをはずす。
- 2 下ケースに付いているタッピング ビス2.6×6<sup>m</sup> pタイト3本をはずす。
- ❸ 上ケースのLCD側を持ち、図1の 様に押し開き上ケースと下ケースを 完全に分離する。

#### **CIRCUIT DESCRIPTION**

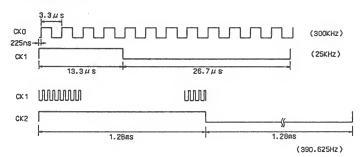

The DR-220 incorporates a multi sound source system in which plural sound data stored in a ROM are called by a multi-address counterin the timesharing fashion. The data read are converted to analog equivalents via a DAC. The system has found applications in many Roland and BOSS products. Built in the DR-220 is the most advanced Roland's custom-gate array MB670120. The gate array has some associated stages not found on its predecessor.

The sound ROM. IC2. contains 11 sound data which will be be read sequentially by the 6 counters in the gate array. The data are then converted to analog voltages via an R-2R ladder resistor and op amp.IC5. The DMUX. IC6. connects the signals to correct audio channels, respectively. The gate array generates not only multiple addresses but also the CPU system clocks, CKO-CK3 -- can be said to be the central part of the DR-220.

#### 1. Timing Generator

The timing generator in the gate array generates various clocks (see figures below) from the 2.4MHz ceramic externally connected to X1 and X2 terminals. These clocks determine the channel for a given output sound and the timings of the data reading and whole system functions.

#### SYSTEM CLOCK

#### 2. Memory Accessing

The CPU, IC101, accesses memories ( RAM, IC3 and ROM, IC2 ) through the gate array. The address as well as data are transferred over the data bus between gate array BO-B7 and CPU I/O ports. The procedures are described briefly as follows.

2-1. CPU - selects a memory with the CS:

low CS=ROM: high CS=RAM

B0-B7

an internal latch

- 2-2. CPU places the upper addresses A8-A15 on
- 2-3. CPU pulls ALEH low
  GAte array latches the upper addresses into

## 概説

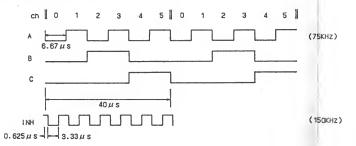

DR-220ではマルチ音源システムが採用されています。マルチ音源システムとは、ROMに格納されている複数の音源の波形データを、マルチ・アドレスカウンタによって時分割で読みだした後、アナログ電圧に変換する方式です。本方式は既にローランドおよびボス製品で使用されていますが、本機では、周辺回路も含んだ集積密度の高いゲートアレイがアドレス・カウンタとして採用されています。

音源ROM(IC2)内の11種類のサウンドデータは、ゲートアレイ(IC1)の6チャンネル・アドレスカウンタにより順次読み出された後R-2Rラダー抵抗(R19)とオペアンプ(IC5)でアナログ電圧に変換されます。つぎにDMUX(IC6)によって指定チャンネル(クロックA、B、Cによって決まる)へ出力されます。 ゲートアレイは、マルチアドレスの他、 CPUのシステムクロック CK0、CK1、CK2 およびリセットも発生します。したがって、DR-220ではゲートアレイの方がより中心的な役目を果たしていると言えます。

#### 1. タイミング・ジェネレータ

ゲートアレイのタイミング・ジェネレータには  $2.4\,\mathrm{MHz}$  のセラロックが  $X\,1$ 、 $X\,2$  端子に外付されています。 タイミングジェネレータ の出力波形を 下表に示します。 これらの クロックは、音の読み出し タイミング や出力 チャンネルの選定以外にも システム全体の動作タイミング も決定するので、 $D\,R\,-\,2\,2\,0$  の心臓部と云えます。

#### **DMUX TIMING**

#### 2. メモリ・アクセス

CPU(IC101)はゲートアレイを通じてメモリ(RAMIC3、ROMIC2)にアクセスします。アドレス及びデータはゲートアレイのB0-B7とCPUOI/Oポート間で転送されます。概要は次の通りです。

- (1) (CPU) アクセスすべきメモリをCSで選ぶ CS: L = ROM、 H = RAM
- (2) (CPU) B0-B7へ上位アドレス (A8-A 15)を出力
- (3) (CPU) ALEHをLにする (ゲートアレイ) ALEHの立下がりで、アドレス を内部アドレスラッチにラッチ

- 2-4. CPU places the lower addresses AO-A7 on BO-B7
- 2-5. CPU pulls ALEL low

  Gate array latches the lower addresses
- 2-6a. Data Reading
  - When the CPU pulls OE low, the gate array outputs data on BO-B7.
- 2-6b. Data Writing

The CPU represents data on BO-B7 and then a low WR.

The gate array writes the data into the RAM IC3.

- (4) (CPU) B0-B7へ下位アドレス(A0-A7) を出力
- (5) (CPU) ALELをLにする

(ゲートアレイ) ALELの立下がりで 下位アド レスをラッチ

#### (6A) 読出し時

(CPU) OEをLにする

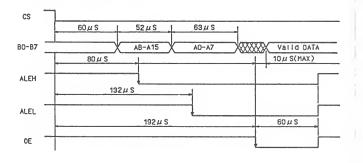

(ゲートアレイ) データをBO-B7へ出力

#### (6B) 書込み時

(CPU) B0-B7ヘデータを出力し、WRをL にする

(ゲートアレイ) データを取り込みRAMに書込む

#### 1. Rend Timing (ROM)

#### 3. Sound Output

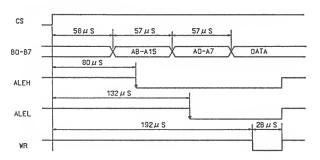

The following discussion is limited to a description of open hi-hat, OH, in the manual mode. The encircled figures refer to those in the diagram that follows.

① Upon pressing OH button, the CPU sends, via gate array, to the RAM, IC3, an 8-bit data OH "Out data". The OH out dta contains:

OH "Level data" that has been set from the front panel using OH LEVEL, and OH "Channel data" that specifies sound to be generated.

- @ RAM addresses 0-5 are memory space for working area which is divided into 6 with no. 4 being assigned to sound channel 4 which will store 0H Out data.
- $\mbox{\textcircled{3}}$  The gate array is scanning over RAM addresses 0-5 every 6.67  $\mu \, s$ . Upon detecting 0H out data in the location 4, it starts address counter no. 4. With the counter no. 4 output, the gate array reads 0H wave data from the corresponding memory loca tion in the ROM, IC2, through the data bus DO-D7, and repeats reading at 40  $\mu \, s$  intervals as the counter increments.  $\mbox{\textcircled{4}}$  The gate array processes the 8 bit data based on
- ① The gate array processes the 8 bit data based on OH Level data, converting it to a 12-bit data and placing it on DAO-DA11.
- ⑤ The 12-bit data is converted to the analog voltage at the DAC output consisting of R19 (R-2R ladder resistor) and IC5 and is sent to IC6, DMUX.

## 2. Write Timing (RAM)

#### 3. 音出し

マニュアルでオープン・ハイハット (OH) を押した場合を 例として説明を進めます。丸印内の番号は下のブロック図中の番号に対応します。

- ① CPUは、OH ボタンが押されると、パネルの OH・LEVEL の設定値に応じた OH "LEVEL"データ および、 OH を示す OH "CHANNEL"データを、8ピットの OH "OUT"データ として ゲートアレイを介して RAM IC3 へ送り込みます。
- ② RAM の 0-5番地はワーキングエリアで、0 から5 迄のサウンド・チャンネルにそれぞれ割り当てられています。 OH "OUT" データは 4チャンネル に対応する4番地に書き込まれます。
- ③ ゲートアレイは、RAMの 0-5番地を  $6.67\mu$ S 毎 にスキャンしており、4番地に "OUT" データ が書き込まれてあれば、チャンネル 4の カウンタをスタートさせ、その出力値に対応する ROM(IC2)アドレスから OHの波形データを、データバス D0-D7 を通じて  $40\mu$ S 毎に読み込みます。
- ④ ゲートアレイはこの波形データを、OHLEVELデータに基づいてレベル変換した後 DAO-DA11から12 ビットのパラレルデータとして出力します。
- ⑤ このデータは、R19 (R-2Rラダー抵抗)と IC 5でアナログ電圧に変換された後 DUMX (IC6)へ加えられます。

© The DMUX passes this signal onto output pin 1 only during a low INH after the ABC clocks has represented "4" (001).

⑥ DMUXは、 チャンネル・セレクトクロック ABCが 4(001) となると、INH がローの間、OH音を1番ピン から出力します。

#### **WAVEFORM DATA READ CYCLE**

#### When "OH" button is pressed in Manual mode.

#### NOTE:

Low Pass Filter/Envelope

Channels O(BD) and 2 (TOM) of the DMUX undergo varicutoff low pass filtering through Q8 and Q9, respectively. When the gate array counter O starts, the TGO pulse is charged onto C27 whose envelope contours the Q8 cutoff point.

#### TROUBLESHOOTING GUIDE

First see whether the problem resides in the CPU or the gate array.

The followings is a general reference to their functions and defective symptoms.

### **FUNCTIONS**

CPU .	scans switches; drives LCD; flashes LED; processes TRIG IN and OUT; writes sound Out data into RAM IC3 during sound reproduction cycle
GATE ARRAY	supplies CPU system clocks; accesses memories; performs sound reproduction

#### **DEFECTIVE SYMPTOMS**

CPU	no spund (all voices); unable to read switches; failure in LCD driving; incorrect LED flashing; false TRIG IN/OUT
GATE	no spund ( some of the followings
ARRAY	are functioning); LED flashes after rhythm starting; LCD reads other than sound names; test mode works; initialization completes; switches are read
	timbre is not what it should be

CAUTION

R19 R-2R Ladder Resistor

Handle with care frangible components inside.

#### 参考

ローパスフィルター/エンベロープ

DMUX出力のうち、チャンネルO(BD) と2(TOM) にはカットオフ可変の ローパスフィルター Q8、Q9がそれぞれ接続されています。ゲートアレイのカウンタ O(TOM) がったすると、 O(TOM) がらの トリガパルス ガ O(TOM) で O(TOM) をコントロールする エンベロープを発生します。

#### 故障診断上のヒント

故障診断時には、まずCPU、ゲートアレイ、のいずれに原 因があるのかを見極めることが必要です。機能分担の概要と、 代表的な不良内容は次の通りです。

症状にかかわらず、まず各電源電圧を確認して下さい。CP  $U ク \Box ック C K O - C K 2 の確認も大切です。 音源基板の I C を交換する場合、ゲートアレイ は最後にした方がよい でしょう。$ 

#### 機能概要

CPU	スイッチスキャン、 LCD表示、LED点滅 TRIG IN、TRIG OUT処理 音出し時、音出しデータのRAMへの書き込み
ゲート	CPUシステムクロックの供給
アレイ	メモリへのアクセス、 音出し処理

#### 不良症状例

	CPU	ゲートアレイ
	不鳴 (全音源) スイッチ読み込	不鳴(但し、下記の一部は正常 に動作する)
	不可能	
		スタート後のLED点滅
	LCD表示不良	音源名を除くLCD表示
		テストモードの実行
	LED点滅異常	イニシアライゼーション
		スイッチ読み込み
	TRIG IN/	
	OUT 異常	音色不良
1		

#### 注意

R19 R-2Rラダー抵抗の取扱い方について 機械的ストレスに弱いので交換時以外は触れないようにし て下さい。

## TEST PROGRAM (LCD CHECK)

Press and hold TEMPO and LEVEL and switch the power on. The LCD will light all the segments, indicating that the unit is in the test mode. Press SHIFT several times, and the LCD alternately lights full-seg and half-seg.

Note that the unit will remain in this mode until it is turned off.

#### NOTE

24B-14Z-ME2

13919177

When replacing the resistor array with the other type, also replace R32 and R13 with ones to the table below.

R-2R ladder network

抵抗アレイを別種の物と交換した場合は、R32とR13の値を下記のように変更して下さい。

Resistor Array	R32	R13
RKM14L503F(Selected)	82K Ω	100Κ Ω
24B-14Z-ME2	39KΩ	47ΚΩ
